TITLE: The 4th Conference of Young Scientists of the Institute of Geography of the USSR Academy of Sciences (IV Konferentsiya molodykh nauchnykh rabotnikov instituta geografii AN SSSR)

PERIODICAL: Izvestiya Akademii nauk SSSR - Seriya geograficheskaya, 1958,
Nr 2, pp 151-153 (USSR)

ABSTRACT: In 1957, the 4th regular Conference of Young Scientists of the Institute of Geography of the USSR Academy of Sciences was convened. The conference heard the following reports: S.S. Savina and Yu.I. Spiridonova on the climatology and meteorology of the European part of the USSR; L.I. Mukhina on the natural division into districts of the Vitim plateau; N.M. Stupina on the reasons for the destruction of forests in western Siberia; A.A. Velichko on the physical-geographical conditions of the upper paleolithic period in the basin of the central Desna; V.S. Zaletayev on birds of the Mangyshlak peninsula; Z.S. Chernysheva on the linear profiles of rivers of the Trans-Volga area in connection with new tectonic movements; D.A. Liliyenberg on special features in the relief and new tectonics of Kazakhstan; K.N. Argasova on the structure of the valley and bed of the Zhenadar'ya; A.D. Armand on problems concerning the

AUTHORS: Filippova, N. A., Savina, Ye. V., Korosteleva, V. A.

TITLE: Production and Identification of Zinc Stannate

PERIODICAL: Zhurnal neorganicheskoy khimii, 1960, Vol. 5, No. 7,
pp. 1423 - 1427

TEXT: The authors attempted to identify the compound formed in the fuming process of slags containing tin. This compound is difficultly soluble in dilute sulfuric acid, and is an obstacle to the full yield of tin. Papers by A. K. Yevdokimova, A. I. Migina, and A. A. Tseydler (Ref. 1), V. V. Kostelov and V. S. Morachevskaya (Ref. 2) identified the unknown products as zinc stannate of a hitherto unknown composition. The authors of the present article prepared the following specimens from ZnO and SnO₂:

I: molar ratio ZnO : SnO₂ = 1 : 1; 4 h heating to 1200°C; II: ZnO : SnO₂ = 2 : 1, same treatment; IIa: ratio as in II, but heating for 8 hours; III: ZnO : SnO₂ = 3 : 1, treatment as in I and II; IV: ZnO : SnO₂ = 2 : 1,

initial heating for 4 hours, followed by additional 8 hours. Free ZnO and free SnO_2 were identified in calcined mixtures whose weight had remained unchanged. Table 1 gives the amounts of free ZnO and SnO_2 along with the analytical data for the four specimens. IIa consisted of Zn_2SnO_4 at 96.8%. The mixture 1 : 1 contained an excess of SnO_2 , and the mixture 3 : 1 an excess of ZnO. Fig. 1 shows a microscopic picture of zinc stannate. The X-ray analysis performed with a YPC-50-N (URS-50-I) apparatus yielded the interplanar spacings for Zn_2SnO_4 in agreement with data available in literature. A reaction in the solid phase takes place at 1200°C in a mixture of 2 moles of ZnO and 1 mole of SnO_2 , and the resulting product is Zn_2SnO_4 . This compound is difficultly soluble in dilute H_2SO_4 , and is therefore responsible for the incompleteness of zinc extraction in the fuming process. There are 2 figures, 2 tables, and 6 references: 5 Soviet and 1 US.

TITLE: Phase Analysis of Lead Industry Dust for Selenium Compounds

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 4, pp. 401 - 410

TEXT: Various solvents were tested to find a scheme for the phase analysis of lead dust for selenium compounds (Table 3, solubility of selenium compounds in the solvents investigated). The following selective solvents were found: methanol for selenium dioxide, 0.5 M acetic acid for zinc selenite, an 0.5 M sodium chloride solution for mercury selenite, 0.5 M citric acid for lead selenite, a 1.5 M sodium sulfite solution for elementary selenium, an 0.1 N potassium bromide solution in 0.1 N sulfuric acid for zinc selenide, and 7 N nitric acid for lead selenide. An 0.25 M Trilon solution was found to dissolve all selenites. Solubilities were investigated using selenium preparations. Microscopic analyses were made by R. D. Kulichikhina and the structural analyses with X-rays by Ye. V. Savina (Table 1, composition of selenium preparations). The possibility of determining selenium dioxide, zinc selenite, lead selenite and mercury

Card 1/2

B010/B006

selenite separately was verified using mixtures of radioactive (Se^{75}) preparations of these compounds. Owing to the complex composition of the dust, however, zinc selenite and lead selenite can not be determined separately in industrial samples. The phase analysis of a dust sample admixed with selenium compounds showed that the added amounts were found analytically. A scheme for the phase analysis was developed. Tables showing the composition of the samples investigated (Table 5) and the results obtained by the phase analysis of these samples (Table 6) are given. A handbook by K. B. Yatsimirskiy and V. P. Vasil'yev (Ref. 9) is mentioned in the paper, giving the values of the equilibrium constants of lead- and zinc selenite (Table 2) published in it. There are 6 tables and 9 references, 7 of which are Soviet.

TITLE: Hygienic investigation of cosmonaut clothing designed for wear in a small space cabin under shirtsleeve microclimate conditions

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy kosmicheskoy biologii, v. 4, 1965, 180-187

TOPIC TAGS: cosmonaut hygiene, space suit, spacecraft capsule environment, space physiology, skin physiology, hygiene

ABSTRACT: Contemporary ^{2, 44} spacesuits worn continuously inflict considerable discomfort and inconvenience on the wearer. This has been one of the factors prompting development of shirtsleeve cabin atmospheres permitting the wearing of light, porous clothing.⁴⁴

The most important hygienic function of clothing is keeping the skin free of dirt. In space, where the various kinds of dust ordinarily present in the environment are absent, the main contaminants of skin and clothing are the products of human vital activity (skin gland secretions, sloughed epidermis, falling hair, and particles of urine and feces).

Card 1/3

L 14250-66

ACC NR: AT6003852

Weight penalties make the carrying of changes of underwear or the cleaning of underwear in flight impracticable. Therefore, ways must be found to enhance the skin cleaning capability of underwear.

Knitted fabric has a number of advantages: 1) better fit, 2) economy of space in packing, 3) convenience in placing physiological sensors. For shirtsleeve cabins, knitted sportswear was found best. Chamois slippers were worn as footgear.

Samples of the clothing were worn in thermochamber, cabin-mockup, and Vostok flight tests. In order to evaluate the skin-cleaning capability of the clothing, methods were devised to measure the degree of soiling by analyzing bath and wash water.

The clothing was worn in 30-day tests without washing, and the condition of the skin under the clothing was determined by clinical and laboratory methods. Skin condition is stated to have remained wholly satisfactory. Hyperkeratosis, scaling, some folliculitis simplex, isolated boils, dermatitis, and acne vulgaris were observed, but none of these conditions interfered with the work capacity of the subjects or prevented completion of the experimental program.

Vserossiyskaya konferentsiya professorov i prepodavately pedago-gicheskikh institutov

Primenenie ultrazvukov k lastodownym veshchevym; trudy konferentii, Vyp. 7 [Application of Ultrasonics for Analysis of Substances], Transactions of the All-Russian Conference of Professors and Teachers of Pedagogical Institutes, Nr. 7] Moscow, Izd. MOPI, 1958. 283 p. 1,500 copies printed.

Tech. Ed. I. S. P. Zhitovi; Eds.: V. P. Kondrakov, Professor, and B. B. Kudryavsev.

PURPOSE: This book is intended for physicists, technicians, aeronautical engineers and other persons concerned with ultrasonics.

COVERAGE: The book contains twenty eight articles which treat ultrasonic phenomena in three general categories: 1) historical data on the development of ultrasonics in the Soviet Union over the past forty years; 2) the speed of sound in suspensions of varying concentration and number and the relationship of electrolyte; 3) ultrasonic investigations of physical and chemical properties of materials and the determination of aqueous solutions, adiabatic compressibility, density of solutions (with given temperatures), viscosity, surface tension, saturation pressure and also ultrasonic investigation of carbon content and petrographic state of coal; 4) industrial applications of ultrasonics, e. g. emulsification of reagents, cleansing of textile fiber and enhancing the susceptibility of some synthetic fibers to dyes, etc.; and 5) apparatus which produce ultrasonic waves. No personalities are mentioned.

References accompany each article.

TITLE: Endurance of high temperatures by humans and the importance of heat-protecting clothes

PERIODICAL: Voyenno-meditsinskiy zhurnal, no. 9, 1960, 72 - 74

TEXT: The present work is a continuation of earlier investigations (Ref. 1: Voyenno-Meditsinskiy Zhurnal, No. 8, 56 - 58, 1958), and compares the influence of normal and semi-seasonal clothing of pilots at temperatures of 70, 80, 90, 100, 110, 120°C. The experiments were carried out in a heat chamber where the air was rarified to correspond to an altitude of 8000 meters. The subjects wore cotton underclothes under a high-altitude compensating dress. The outer clothing in one group consisted of cot-

Endurance of high temperatures...

is constant within the range of temperatures investigated and it is 63 ± 10 kilocalories per square meter of the body surface. The sooner this limiting value is reached the shorter the time duration endurable at high temperatures. The experiments show that the speed of heat accumulation in the organism is lower with the semi-seasonal dress. It appears that the external heat load operating on the organism is in the average 25% lower with the semi-seasonal dress. Water losses through evaporation, heat transmission and accumulation of water in the clothing were also lower with this types of dress. Reduced sweating is a direct consequence of the lower external heat loading. Although the heat transmission is reduced by 15%, evaporation takes place more effectively because of the smaller absorption in the clothing. The average time endured at high temperatures in the two kinds of clothing are shown in tabulated form. There are 4 tables and 1 Soviet-bloc reference.

TEXT: A small-sized ultrasound device is described, which is suitable for investigations related to the measurement of absorption and velocity of propagation of ultrasound oscillations under extremely varied physico-chemical conditions, in particular those relating to oil and oil products. The block diagram and the circuit diagram of the device are given. In order to determine the saturation pressure and crystallization temperature of paraffins it is sufficient to obtain data on the attenuation of ultrasound. The device has a thermostatically controlled vessel with two transducers, a pulse genera-

velocity, ultrasonic delay line, irregular ultrasonic delay line,
beam splitting method, single probe measurement, double probe mea-
surement

Card 1/3

ACCESSION NR: AR4022455

TRANSLATION: It is proposed to measure the coefficient of absorption of a liquid and the ultrasound wave propagation velocity as functions of p , V , T , with the aid of irregularly shaped acoustic delay lines. The acoustic system consists of two cylindrical delays with precision-polished ends to ensure reliable acoustic contact. One of the delays has a step-like cut with a cross section area equal to half the area of the cylinder. The delay with the cut splits the ultrasound beam into two equal halves. The measurements are based on the fact that each half of the ultrasound beam in the liquid covers a different path length. This leads to a time separation of the radio pulses at the output of the acoustic system and to a difference in their magnitude, owing to the inequality of the absorption coefficients of the liquid and of the delay-line material. The measurements are made with either a single or a double probe. In the former case the quartz slabs must be strictly coaxial. The delays are made of fused quartz, aluminum, or some other material with known absorption coefficient. Simple calculations show that

Card 2/3

ACCESSION NR: AR4022455

by knowing the ratio of the radio pulses at the output of the acoustic system, the depth of the cut, and the coefficient of absorption of the delay line, it is possible to determine the absorption coefficient of the investigated liquid when using two probes; when a single probe is used, it is necessary to have the same data, except for the absorption coefficient of the delay. However, with a single probe scheme it is necessary to calculate more accurately the geometrical parameters of the autoclave. The ultrasound propagation velocity in the liquid can be roughly determined by the method of irregularly-shaped delay lines from the known delay time of a pulse passing through the longer path in the liquid. Formulas are derived for the absorption coefficient and for the ultrasound propagation velocity in the liquid. V. Bashkirov.

TITLE: Spray Metal Coating Using h-f Currents

PERIODICAL: Byul. nauchn.-tekhn. inform. po elektrifik. s.kh. Vses. n.-i.
in-t elektrifik. s.kh. 1957, No. 3, pp. 42 - 44

TEXT: The author gives a brief description of the MB4-1 (MVCh-1) h-f device developed by the Zaporozh'ye Branch of the VIESKh. The sprayer head of the device operates according to the concentrator principle and is supplied with current from a tube oscillator through a special co-axial water-cooled cable. The metal to be sprayed is supplied to the head in the form of a wire of 5-6 mm diameter at an adjustable speed with the aid of a feed mechanism driven by a 85-w electric motor. Contrary to the multi-layer spraying applied for ordinary metal coating operations, for h-f metal coating, it is recommended to apply the required thickness of coating in one operation in order to improve the quality. It is pointed out

Spray Metal Coating Using h-f Currents

that with h-f metal coating the working conditions and the quality of the coating are improved, and metal losses are reduced by 2 - 3 times.
